

Section 2: Fuel and energy use indicators

Fuel purchased for use in vehicles and the household

The survey obtained information about both the quantity and the cost of petroleum products purchased by households for use in motor vehicles and in the household, and similar information about solid fuels used by the household.

The information has been presented in a series comprising 81 tables, covering fuels and lubricants for use in motor vehicles, fuels and lubricants for use in portable electricity generators, then liquefied gas, liquid and solid fuels used for domestic cooking and heating. Separate tables are presented for urban and rural households, and for combined urban and rural households.

Quantity purchased and total cost of petroleum fuels purchased by households for use in motor vehicles, tabulated by household expenditure decile groups

The household expenditure, quantity purchased and calculated average price for vehicle fuels have been tabulated by household expenditure groups, with separate tables for premium gasoline (“benzine”), for regular gasoline (“gasoline”) and for diesel fuel and all vehicle lubricants (Tables 2.1 to 2.27).

The survey results indicate that the average monthly household consumption of premium gasoline (benzine) amounted to 138.9 litres, with 137.5 litres in urban areas and 141.9 litres in rural areas (Tables 2.1 to 2.3). Of the total amount, 71.3% was purchased from official stations against 22.7% purchased from the informal reseller market. The average total cost of premium gasoline purchased was 10,195 ID in urban areas, 16,250 ID in rural areas, and 12,139 ID overall (Tables 2.4 to 2.6).

The consumption of and total amount paid for benzine increased across the household expenditure decile groups, with the lowest decile groups spending 799 ID in urban areas, 66 ID in rural areas and 730 ID on average, while the highest decile groups spent 21,891 ID in urban areas, 54,816 ID in rural areas and 33,384 ID on average (Tables 2.4 to 2.6). Consumption of benzine was low for decile groups 1 to 4, increased sharply for deciles 5, 6 and 7, while deciles 8, 9 and 10 consumed more than half of the total (56%).

The average price paid per litre of benzine was 44.3 ID for fuel purchased from official stations and 234.5 ID for purchases from trade market (Tables 2.7 to 2.9). The variations in average prices between urban and rural markets were minimal. Across the decile groups, the average prices paid for benzine purchased from stations and from the trade market did not vary greatly, except for the lowest expenditure decile in rural areas, where the price reported for fuel from stations was 20 ID/litre, although the average quantity purchased was quite small.

Regular gasoline is not widely used as a vehicle fuel by households, especially in urban areas. Overall, decile groups 1 to 4 consumed 0.8 litres on average, deciles 5 to 7 an average of 4.1 litres, and deciles 8 to 10 an average of 33.6 litres (Tables 2.10 to 2.12).

The consumption of regular gasoline in rural areas was significantly higher, and that in urban areas significantly lower, possibly reflecting the wider availability of premium gasoline in urban areas, or alternatively the wider use of older gasoline powered vehicles by rural households.

The average monthly household expenditure on regular gasoline was 303 ID in urban areas, 899 ID in rural areas, and 494 ID on overall average (Tables 2.13 to 2.15).

Average prices paid for regular gasoline were 22.4 ID per litre for fuel from stations, 76.2 ID per litre for fuel from the trade market, an average of 42.2 ID per litre overall (Tables 2.16 to 2.18).

Household use of diesel fuel was so low that the quantities purchased were combined with those of engine lubricants in the survey reports (Tables 2.19 to 2.27). Average expenditure on diesel fuel and lubricants was 1439 ID per household, with little variation between rural and urban areas. The average price per litre was 1489 ID, again with little variation, reflecting the price of lubricants rather than diesel fuel.

Quantity purchased and total cost of petroleum fuels purchased by households for domestic use in electricity generation, tabulated by household expenditure decile groups

The household expenditure, quantity purchased and calculated average price for generator fuels have been tabulated by household expenditure groups, with separate tables for premium gasoline (“benzine”), for regular gasoline (“gasoline”) and for diesel fuel and all engine lubricants (Tables 2.28 to 2.54).

The survey showed that the average household monthly consumption of benzine (premium gasoline) for use in private generators was 55.3 litres, with 61.5 litres consumed in urban areas and 42.1 litres in rural areas (Tables 2.28 to 2.30). Benzine purchases from trade market at 61% exceeded purchases from stations at 39%, mainly because households that did not own motor vehicles were unable to buy fuel from official stations. (This situation has since changed, with special stations having been established to supply fuel to fill containers for household use, albeit at higher prices, at least in Baghdad.). Urban households were able to purchase 41% of their fuel from stations, while rural households purchased only 33% from such outlets.

The average household monthly expenditure on benzine for generator use was 9,250 ID, with urban households spending an average of 10,022 ID and rural households 7,616 ID (Tables 2.31 to 2.33). Average household expenditure trended steadily upwards across expenditure groups, from a low of 1,083 ID for the lowest expenditure group to 15,659 ID for the highest expenditure group. For decile groups 1 to 8, rural households spent about half as much as urban households on benzine for generators, but for decile groups 9 and 10, rural households spent slightly more, on average.

The average price per litre for benzine purchased from official stations was 42.4 ID and from the trade market 247.5 ID (Tables 2.34 to 2.36). There was little variation from these average prices between urban and rural households, but the overall average price ranged from 163 ID per litre in the urban regions to 180.7 ID per litre in rural areas, with an overall average of 167.4 ID per litre. The difference mostly reflects the higher proportion of fuels that rural households purchased from the trade market, relative to urban areas and the overall sample.

The average monthly household expenditure amount on gasoline for use in private generators was 2.6 litres, with 2.0 litres for urban households and 4.0 litres for rural households (Tables 2.37 to 2.39). On average, 45% was purchased from stations and 55% from the trade market. The average total cost was 94 ID overall, with 76 ID spent in urban areas and 131 ID in rural regions (Tables 2.40 to 2.42). The average price paid per litre was 35.6 ID overall, 21.3 ID for purchase from stations and 78.4 ID for purchase from trade outlets, with little variation between urban and rural regions (Tables 2.43 to 2.45).

Household use of diesel fuel for generators was so low that the quantities purchased were combined with those of engine lubricants in the survey reports (Tables 2.46 to 2.54). Average expenditure on diesel fuel and lubricants for use in generators was 741 ID per household, with limited variation between rural and urban areas. The average price per litre was 1411 ID, again with little variation, reflecting the price of lubricants rather than that of diesel fuel.

Quantity purchased and total cost of petroleum fuels purchased by households for domestic use in cooking and heating, tabulated by household expenditure decile groups

The household expenditure, quantity purchased and calculated average price have been tabulated by household expenditure groups, with separate tables for liquid gas (LPG) and for kerosene (Tables 2.55 to 2.72).

The average monthly household consumption of liquid gas (LPG) used in cooking and heating amounted to 2.6 cylinders, with little variation between urban (2.7) and rural (2.4) regions (Tables 2.55 to 2.57). The quantity of cylinders purchased per month ranged between 1.5 in the lowest expenditure decile group (1.6 for urban and 1.1 for rural regions) and 3.3 in the highest expenditure decile group (3.2 for urban and 3.5 for rural regions). On average, 14.8% of cylinders were purchased from stations and 85.2% were purchased from trade market, including cylinders delivered to the home. These percentages did not vary much between urban and rural markets, or with expenditure decile group.

Average monthly household expenditure on liquid gas was 3,226 ID, with similar figures of 3,273 ID for urban areas and 3,126 ID for rural regions (Tables 2.58 to 2.60). The average cost ranged from 1,886 ID for the lowest expenditure decile group to 4,645 ID for the highest, with limited differences between urban and rural households in each decile, except that rural households in the lowest decile spent on average 1,500 ID, compared to 2,095 ID for urban households (Tables 2.58 to 2.60).

The average price of liquid gas cylinders purchased from stations was 859 ID and from the trade market 1297 ID (Tables 2.61 to 2.63). The ex-depot price was essentially the same in urban and rural areas, while the average market price was 1,272 ID in urban areas and 1,354 ID in rural regions. The prices paid varied by less than 20% across expenditure decile groups, with lower decile group households benefiting from lower prices on average.

The average monthly household consumption of kerosene was 25.8 litres, with averages of 23.6 litres in urban areas and 30.4 litres in rural areas (Tables 2.64 to 2.66). These figures represent consumption during May, which is likely to be doubled or trebled in the winter months. Household consumption of kerosene varied by a factor of 10 between the lowest decile group (5.3 litres) and the highest expenditure decile group (59.4 litres). Urban households showed a similar range of variation in kerosene

consumption, but among rural households, the lowest expenditure decile group used on average 3.1 litres, while the highest decile group used 93.4 litres, 30 times as much fuel. In both urban and rural areas, the higher three deciles consumed more than half of the total amount of fuel.

On average, just over half of the kerosene (51%) was purchased from stations, and 49% from the market. In urban areas, 45.9% was purchased from stations and 54.1% from the market, while in rural regions, 59.5% was purchased from stations and 40.5% from the market. In urban areas, the lowest expenditure decile group purchased a greater proportion from stations, and the highest decile group more from the market, whereas in rural areas, the lower two decile groups purchased more from the market, and the highest decile group more from stations. These differences may reflect the easier access to official stations in urban areas, for people with limited means.

Average monthly household expenditure on kerosene was 2,127 ID, with urban households spending on average 2,195 ID and rural households 1,983 ID (Tables 2.67 to 2.69). The trends in relative amounts spent across deciles followed the pattern of trends in consumption, with a wider spread, ranging from 372 ID for the lowest decile group to 4,541 ID for the highest, a ratio of more than 12.

The average price paid by households per litre of kerosene was 82.6 ID (Tables 2.70 to 2.72). The average cost per litre for fuel purchased from stations was 25.8 ID, and from the market 141.7 ID. Each of these average prices was a little higher in urban areas and a little lower in rural regions. Average purchase prices fluctuated across the deciles, in both urban and rural areas, with no clear trends in the price of fuel purchased from stations or from the market. Prices for kerosene from stations varied from 15.1 to 41.0 ID per litre among the urban and rural decile groups, all in excess of the official price of 5 ID per litre. Average prices in the market for different decile groups varied from 86.3 ID to 174.2 per litre.

Quantity purchased and total cost of solid fuels purchased by households for domestic use in cooking and heating, tabulated by household expenditure decile groups

The household expenditure, quantity purchased and calculated average price have been tabulated by household expenditure groups for solid fuels, including wood, charcoal and crop residue (Tables 2.73 to 2.81).

The average monthly quantity of solid fuel purchased by households was just 0.6 kg, with urban households using 0.3 kg on average, and rural households 1.3 kg (Tables 2.73 to 2.75). The highest use in any decile group was 2.6 kg per month. Overall, 2/3 of the solid fuel purchased was wood, and 1/3 was crop residues. The average monthly expenditure on solid fuels was 96.3 ID, with urban expenditure averaging 46.0 ID and rural expenditure 203.2 ID (Tables 2.76 to 2.78). The average price paid for solid fuel was 150.3 ID per kilogram, with wood fuel costing 114 ID/kg, charcoal 559 ID/kg, and crop residue 148.5 ID/kg, on average (Tables 2.79 to 2.81).

Electrical energy purchased for use in the household

The survey obtained information about both the quantity and the cost of electrical energy purchased by households for domestic use, obtained from the public network, from private suppliers, and from any other sources.

The results are presented in a series of 18 tables, covering electricity purchased from the public network, and electrical supply capacity purchased from private suppliers. There were no other sources of supply identified (other than private household generation, which is covered in the fuels section). Separate tables are presented for urban and rural households, and for combined urban and rural households.

Quantity purchased, total cost and the average price of electricity purchased by households from the public network, tabulated by household expenditure decile groups

The household expenditure, quantity purchased and calculated average price have been tabulated by household expenditure groups for electrical energy supply, sourced from the public network, as well as solar generation and other supply sources (Tables 2.82 to 2.90).

In this category, the only source of supply was the public network (the supply of electrical energy capacity from private networks is covered in a separate section below).

Despite the restricted availability of electricity supply from the public network, and household dependence on private electricity generation, the average monthly household consumption of electricity from the public network amounted to 1,270 kWh (kilowatt hours), with an average of 1,384 kWh in urban areas and 1,031 kWh in rural regions (Tables 2.82 to 2.84). Average household consumption in urban areas varied steadily from 1,140 kWh for the lowest expenditure decile group to 1,692 kWh for the highest decile group. In rural areas, there was a similar progression from an average of 891 kWh in the lowest decile group to 1,169 kWh in the highest decile group.

The average amount spent monthly by households on electricity from the public network was 2,132.5 ID, with the average for urban households at 2,465 ID, and for rural households at 1,429.2 ID (Tables 2.85 to 2.87). Average household expenditure on electricity increased across the decile expenditure groups, ranging from 1,456 ID to 4,967 ID among urban households, and from 1,139 ID to 2,165 ID among rural groups.

The average price paid by households for electricity from the public network was 1.7 ID per kWh, with urban households averaging 1.8 ID per kWh, and rural households 1.4 ID per kWh (Tables 2.88 to 2.90). Average prices were in the range 1.2 to 1.8 ID per kWh for most decile groups, except for urban decile groups 9 (2.1 ID/kWh) and 10 (2.9 ID/kWh) and rural group 10 (1.9 ID/kWh). All of these are extremely low prices by world standards.

Capacity purchased, total cost and the average price of electrical supply capacity purchased by households from private suppliers, tabulated by household expenditure decile groups

The household expenditure, quantity purchased and calculated average price have been tabulated by household expenditure groups for electrical energy supply capacity purchased on a “supply as needed” basis from private suppliers (Tables 2.91 to 2.99).

To provide for electricity supply when supply from the public network is interrupted, households can enter into arrangements with private network suppliers. These are usually priced on the basis of supply capacity, measured by the guaranteed electrical current capacity of the wiring, measured in amperes (amps). At the standard supply voltage of 240V, a 10-amp supply would provide about 2.4 kW of capacity, enough for domestic lighting or for one small electrical appliance. The private generators do not usually provide energy to households when supply is available over the public network.

The average supply capacity purchased by households from private generators was 1.1 amps, with urban households averaging 1.4 amps and rural households 0.5 amps (Tables 2.91 to 2.93). These are averages, and it is likely that a relatively low proportion of households subscribe to somewhat higher supply capacity under such arrangements. The highest average capacity was 2.4 amps for the highest income decile group in urban areas.

The average monthly amount spent on fees to private generators was 3,609 ID, with urban households averaging 4,778 ID and rural households 1,125 ID (Tables 2.94 to 2.96). The average cost ranged from 1,918 ID to 9,237 ID across urban household expenditure decile group, and from 435 ID to 1,284 ID across rural decile groups.

The average price paid for private network generation capacity was 3,256 ID per ampere, with urban households averaging 3,378 ID/amp and rural households 2,454 ID (Tables 2.97 to 2.99). Average prices per ampere capacity ranged from 2,818 ID to 3,925 ID across urban household expenditure decile groups and from 543 ID to 3,786 ID across rural decile groups. The second lowest price in the rural decile groups was 2,487 ID, so the low price reported for the lowest group may not be representative.

Even if the private network supply were provided 24 hours per day, 7 days per week, the average cost for each kWh of generated electricity would be 81 ID, much more than the average of 1.7 ID per kWh paid for electricity from the public network. With reduced hours of private generation, the average cost of the electricity purchased per kWh would be significantly higher. This can be compared with the cost of a 5 kW gasoline powered generator, using 5 litres of benzine per hour, costing 167 ID per litre. The cost of each kWh generated would then be 167 ID, plus amortization of the cost of the generator. However, the private generator is only run when needed, while the private network supply cost is fixed, independent of the actual hours of supply required.
